

New investments in the Dairy field

For several years dairy has been considered a stable sector, nevertheless, against the trend of other European producers, ILPA-MP3 has invested over 2.5 millions of euros in 2009 with the objective of improving production quality of the latest generation of finished film FFS (form-fill-seal).

At the beginning of October 2010 a new production line will become operative, it will be capable of guaranteeing quality performance of extremely high levels.

This innovative production line has been studied by ILPA together with the supplier company engineers to assure an excellent quality of the PS foil. It is increasingly necessary to guarantee an optimal level of service to the modern FFS machines in the dairy field (yoghurt, coffee-cream, butter etc...).

The target of MP3 is to consolidate their market position to become among the top-five European producers in the sector.
ILPA-MP3 has worked with the main yoghurt producers for more than 25 years.
